

ABSTRACT

A steam cleaner includes a container having a chamber to receive a steam generator, and a housing having a space to receive a portion of the container and having one or more spacers extended
5 into the space and engaged with the container, to form an air passage between the container and the housing. The housing includes a number of apertures for allowing air to flow through the air passage and to cool the housing. The container includes a front tube to receive an outlet port of the steam generator. A nozzle may
10 be detachably attached to the container. An extension shank may be detachably attached to the rear portion of the container.
